

Ques1. Can we apply more than one css class to html tags? If yes, how to implement?

Ans: To use multiple CSS classes in one HTML tag, you can separate the class names with a space within the class attribute of the HTML tag.

For example, let's say you have the following CSS classes defined:

```
css
.my-class {
  color: blue;
}

.another-class {
  font-size: 20px;
}
```

You can use both classes on an HTML element like this:

```
html
<p class="my-class another-class">This paragraph will be blue and have a font-size of 20px.</p>
</html>
```
